

GetPawsy — AGP Wave 6A

Autonomous Commander AI · Foundations + Executive War Room

Generated 2026-06-25T10:59:59.842353Z · status: SUCCESS · score: 90/100 · mode: simulation

Executive summary

Wave 6A installs the executive layer above every AGP / ACI / Pinterest / CPE / Cinematic engine. The Commander supervises, decides, and audits — but in Stage 6A it ships in **simulation mode**: it scans health, evaluates goals, plans resources, logs model-routing intent, primes daily budgets, surfaces pending decisions, simulates ROI, and detects engine issues — without invoking any downstream engine and without spending credits. Operators flip mode, autonomy level, and kill switch from /admin/commander.

Stage 6A deliverables

Database	12 tables (RLS admin-read, service-role write)
Edge function	cmdr-orchestrator (8 modules)
UI	/admin/commander Executive War Room (10 tabs + operator controls)
Cron	Daily 04:00 UTC (after AGP 02:00–02:45 and ACI 03:30)
Modes	manual · semi · auto · autonomous · experimental · dry_run · emergency_stop · simulation (default)
Safety	Kill switch, autonomy level (0–5), per-category daily budgets, append-only audit log

Live validation run

Steps OK	8/8
Engines scanned	16
Engines OK / lagging / stale / unknown	8 / 2 / 4 / 2
Decisions created	0
Simulations executed	0
Self-healing issues detected (audit only)	8
Autonomous actions executed	0
Spend	\$0.00

Engines under Commander supervision

· AGP Growth Scorer · AGP Signal Collector · AGP Intelligence · ACI Orchestrator · ACI Recommendations · Pinterest Publish · Pinterest Autopilot · Cinematic V3 · CPE Pipeline · CJ Media · SEO Engine · Stock Sync · Creative Intelligence · Trend Engine · Forecast Engine · Learning Engine

Roadmap

- 6B Model Router + Budget Engine (simulation)
- 6C Goal Engine + Decision Engine + Simulation gate (approval)

- 6D Self-Healing + Business Memory (approval → auto)
- 6E Digital Board Meeting + Master Report (auto)

Safety posture

Default mode is **simulation**. Stage 6A makes **zero** downstream invocations and spends **\$0**. Every Commander action is recorded in `cmdr_audit_log` with reasoning, confidence, expected ROI, and estimated cost. Existing engine guardrails (ACI kill switch, Pinterest credit governor, CPE budget caps, Cinematic dispatch) remain authoritative — Commander never bypasses them.
