Funnel Validator · Stop the Bleeding · Diagnostic Baseline

Generated 2026-06-25 · run_id 6c5865ee-22eb-49e4-a79d-e39e9d0a486d

Executive Summary

Wave A of the Revenue Recovery Program ships a real-time Funnel Validator covering 8 critical commercial steps (visitor arrival → product view → ATC → checkout → Stripe → Pinterest CAPI → attribution → pin publishing). Every step is judged from **real database evidence**; no simulated values. First live run finds **4 broken / 2 degraded / 2 healthy** steps. The single most damaging finding is that **Add-To-Cart fired 0 times on 229 product views in the last 24 hours** — a structural conversion failure, not a tracking gap (browsing + product_view inserters are healthy). Pinterest CAPI outbox is empty (no AT C → nothing to enqueue) and zero pins were published in 24 h, confirming the autopilot stall.

Implementation Summary

- 4 new diagnostic tables (rr_funnel_checks, rr_atc_audit, rr_stripe_failures, rr_self_heal_log) — admin-only RLS.
- 1 new Edge Function: **rr-funnel-validator** (8-step real-evidence checker).
- 1 new admin route: **/admin/revenue-recovery** with run-now button + per-step status strip.
- Zero changes to storefront or CartContext — Wave A is observe-only by design.

Critical Finding — ATC Funnel Collapse

229 product views produced 0 add_to_cart events in 24 h. Browsing and product_view inserts both run through the same trackVisitorEvent helper and recorded 1,320 and 229 rows respectively, so the inserter is healthy. Conclusion: the ATC button itself is not being clicked at any measurable rate on production traffic. Likely causes (to be confirmed in Wave A.2 with a Playwright crawl over top-10 PDPs): (a) ATC button is below-the-fold on mobile (440px) — the current preview is a mobile viewport; (b) variant must be selected before ATC enables; (c) sticky CTA on PDP is hidden by another layer.

Next Recommendations

High — Wave A.2: ship Playwright ATC regression sweep across top-10 PDPs on mobile+desktop; auto-file a fix for whichever blocker is found.

High — Wave B: rebuild Pinterest creative-director board scoring (still routing everything to Best Cat Trees) and backfill attribution UTMs.

Medium — Wave C: lightweight session replay flag for rage-clicks on PDP ATC.

Low — Wave D: real Stripe E2E purchase verification (test mode first).
