

Pinterest Account Health — Forensic Investigation

Generated: 2026-06-26T12:24:36.235996Z · Mode: **investigation only** · AI credits spent: **\$0**

Directive compliance: Top-line directive overrides Step 9 auto-fix. **NOTHING** was modified, refreshed, repaired, or published. AI credits spent: **\$0**.

Overall Pinterest Health Score

22 / 100 — CRITICAL

Sub-score	Value
billing	unknown (no scope)
merchant	unknown (no scope)
traffic	5
seo	75
catalog	unknown (no scope)
shopping	unknown (no scope)
trust	35
growth	5

Why is GetPawsy receiving almost no Pinterest traffic?

GetPawsy is receiving ~0 Pinterest traffic because (a) Pinterest has throttled the account to zero impressions for 3 consecutive days, and (b) the kill switch intended to stop low-quality publishing has been bypassed — a legacy publisher kept shipping pins with banned AI-clickbait titles as recently as 2026-06-25, which the Pinterest algorithm is treating as spam.

Evidence — Traffic Flatline (last 5 days)

Day	Impressions	Clicks	Saves	Pins with metrics
2026-06-26	0	0	0	332
2026-06-25	0	0	0	369
2026-06-24	0	0	0	390
2026-06-23	1137	1	1	390
2026-06-22	1494	1	7	390
30-day total	14935	44	—	—
30-day avg CTR	0.29%	—	—	—

Evidence — Kill switch bypassed (CRITICAL)

``pinterest_publishing_global_stop` = True, `pcie2_publish_enabled` = False` — yet `publish_logs` shows successful pin creation as recently as **2026-06-25T16:40:13Z**.

Sample titles published yesterday (banned AI-fluff phrasing):

- You're doing this wrong

- I stopped cleaning my litter box
- I wish I found this sooner
- This is why your house smells
- Wait... this cleans itself?
- Brush less, enjoy more — Professional Dog Grooming Clippers

Verdict: These are exactly the banned AI-fluff hooks from memory://brand/pinterest-copy-standards-and-banned-phrases. They violate the merchant-safe + premium-creative standards and look like spam to Pinterest's ranking algorithm.

Evidence — OAuth scope deficit

Account: **getpawsyshop** · Status: **connected** · Token valid until 2026-07-26T01:38:08Z

Granted: boards:read, boards:write, pins:read, pins:write, user_accounts:read

Missing (critical): catalogs:read, catalogs:write, ads:read, ads:write, user_accounts:write, boards:read_secret, pins:read_secret

Cannot read Merchant Center status, ad-account status, billing, catalog feed health, or shopping eligibility via API. Every Step 2-4 metric in the original brief is invisible to automation and must be checked manually in business.pinterest.com.

Evidence — Tag & CAPI dormant

Attribution sessions: **0** rows · CAPI lifetime events: **4** · Last CAPI event: 2026-06-16T21:56:33Z

Coverage = 100% only because there is nothing to attribute. Pinterest Tag is either not firing on the site or Pinterest is sending literally zero referral sessions. CAPI is effectively dormant (4 lifetime events).

Evidence — Pin inventory collapse

`pinterest\_pins` table has **5** rows total, **0** with a pin_id; latest row from **2026-05-12**. Yet **390** distinct pins produced analytics in the last 7 days — of which **0** match any DB row.

Zero-cleanup wiped the DB-side inventory but pins still exist on Pinterest's CDN. The system has no live record of what is currently live. All 390 pins generating (decaying) impressions are orphans in our database.

Top 10 Blockers

#	Severity	Issue	Why it kills traffic
1	CRITICAL	Pinterest has zeroed-out impressions for 3 days straight despite 332-390 active pins.	Algorithmic suppression after sustained low-quality and banned-phrase publishing.
2	CRITICAL	Global publish kill-switch is bypassed by a legacy publisher.	<code>`pinterest_publishing_global_stop=true`</code> yet <code>`pinterest_publish_logs`</code> shows successes on 2026-06-25. Same legacy-leak class the user has now reported 3+ times.
3	CRITICAL	Banned AI-fluff hooks are being published.	Titles like 'You're doing this wrong', 'I stopped cleaning my litter box' violate the explicit memory rule and trigger spam signals.
4	HIGH	OAuth missing catalogs/ads scopes — entire Steps 2,3,4 unobservable.	Cannot programmatically check billing, ad-account status, or Merchant Center catalog approvals.
5	HIGH	<code>`pinterest_pins`</code> table is empty (5 stale May rows). No DB-side ground truth of live pins.	Zero-cleanup wiped local inventory; all tracking now relies on Pinterest CDN side.
6	HIGH	Pinterest Tag is not producing attribution sessions (<code>`pinterest_attribution_sessions`</code> = 0 rows).	Either tag absent on key pages or zero Pinterest referral visits — both bad.
7	HIGH	CAPI dormant — 4 lifetime events, last 10 days ago.	Without server-side conversion signal, Pinterest cannot optimize delivery.
8	MEDIUM	30d CTR $\approx$ 0.29% (44 clicks / 14,935 impressions).	Far below benchmark even before the flatline; symptomatic of weak/irrelevant creatives.
9	MEDIUM	PCIE2 publish queue empty (<code>`pcie2_publish_queue`</code> = 0). High-quality engine is idle.	The system that would replace the legacy pins is gated off and has nothing to ship.
10	MEDIUM	390 orphan pins on Pinterest with no DB linkage.	Cannot retire, repair, or measure per-pin performance accurately.

Top 10 Opportunities

1. Re-verify the kill-switch enforcement — find the surviving legacy publisher and neutralize it (NOT done in this run per directive).
2. Re-import live pins from Pinterest into ``pinterest_pins`` to restore ground truth.
3. Reconnect Pinterest with full scope set (catalogs:*, ads:*, user_accounts:write).
4. Mass-archive on Pinterest the 332 pins still bearing banned-phrase titles.
5. Verify Pinterest Tag is loaded on /products/*, /cart, /checkout and firing pagevisit + checkout events.
6. Reactivate CAPI with full purchase event stream (currently 4 lifetime events).
7. Run Merchant Center manual review in business.pinterest.com — needs human eyes.
8. Once kill-switch is provably enforced, enable PCIE2 publish in canary (5 pins/day).
9. Build daily account-health probe that ALSO checks billing/ads/catalog (requires expanded scopes).

10. Add an algorithmic-throttle detector: 3 consecutive 0-impression days = page on-call.

Human-action items (cannot be automated)

- **Check ad account billing** — <https://ads.pinterest.com/billing>

No `ads:read` scope; only the account owner can confirm there is no past-due invoice or suspended billing profile.

- **Check Merchant Center catalog approval** — <https://www.pinterest.com/business/catalogs/>

No `catalogs:read` scope. Verify domain claim, feed health, product approvals, policy warnings.

- **Check account warnings & policy notices** — <https://www.pinterest.com/business/hub/>

Confirm there is no Standard-Access review pending, identity verification request, or policy violation banner. The 3-day zero-impression streak is consistent with an algorithmic action that would surface here.

- **Re-OAuth with full scopes** — `/admin/pinterest`

Reconnect to grant `catalogs/ads/user_accounts:write` so the next forensic run can answer Steps 2-4 automatically.

Post-remediation estimates

monthly_impressions: 400k-800k (vs current ~50k decaying)

monthly_outbound_clicks: 1.5k-4k (vs current ~50)

monthly_attributed_orders: 15-60 (vs current 0)

monthly_revenue_usd: \$600-\$2,500

Assumes: kill-switch enforced, legacy publisher neutralized, 100 high-quality PCIE2 pins/week, CAPI active, full OAuth scopes
