

GetPawsy — Profit Cycle 001

Date: 2026-06-28 · Priority 1 — Prove unknown visitor can buy

Doctrine in effect: every action must increase the probability that an unknown visitor completes a real purchase. From this cycle on, every cycle opens with one question — 'What is the single action with the highest expected increase in verified revenue?' — and nothing else gets built until that question is answered with evidence.

Today's answer: restore funnel telemetry. The hypothesis going in was Stripe-page abandonment. The data forced a higher-leverage answer: the entire post-view_item funnel is blind in analytics_funnel_waterfall (167 view_item, 1 add_to_cart, 0 begin_checkout, 0 payment, 0 purchase) while ground truth in Stripe + orders shows 17 begin_checkout and 1 real purchase. We cannot prioritise commercial fixes while flying blind.

Shipped (3 additive frontend hooks, zero business-logic change)

- CartContext.addItem now fires recordFunnelStep('add_to_cart').
- Checkout.handleStripeCheckout now fires recordFunnelStep('payment') right before window.location to Stripe.
- PaymentSuccess now fires recordFunnelStep('purchase'), idempotent through the existing IpKey guard.

Ruled out (do not waste future cycles on these)

- Geo shipping-country gate is NOT blocking real US traffic — zero shipping_country_blocked events in the past 14 days. The autopsy fired one only because the headless sandbox IP is non-US.
- Analytics-function CORS is healthy at the edge — curl OPTIONS from the getpawsy.pet origin returns 200 with correct headers on all three functions. The browser CORS errors during the autopsy were Cloudflare bot-management blocking the headless probe.

Carried into next cycle

1. Stripe-page abandonment autopsy from a US-origin context: invoke create-checkout via service-role with a real cart, open the resulting Stripe URL directly in Playwright, inspect what real customers see (totals, shipping line, currency, address fields, available wallets).
2. Investigate why begin_checkout is 0 in the waterfall — hook exists on /checkout path, so visitors are likely bypassing /checkout straight to Stripe via a 'Buy now' path.

24-hour validation: re-query analytics_funnel_waterfall and confirm non-zero add_to_cart, payment, and purchase rows after natural traffic. If still zero, the failure is in recordFunnelStep itself (likely a missing session_id at the moment of fire), not in the hook sites.
